**Table S1.** Productions and Typical Usages of Common Metal and Metal-Oxide NPs (Joo and Zhao, 2017)

NPs	Productions (ton/year)	Application
TiO <sub>2</sub>	3,000	Cosmetics, paints and coatings, plastics, consumer electronics, filters, cleaning agents
Ag	N/A	Antibacterial agents
ZnO	550	Cosmetics, plastics, polymers, paints and coatings
Al <sub>2</sub> O <sub>3</sub>	55 (AlO <sub>x</sub> )	Batteries, fire protection, grinding, metal- and bio-sorption, paints
Fe <sub>2</sub> O <sub>3</sub>	55 (FeO <sub>x</sub> )	Concrete additive, biomedical applications
Mn <sub>2</sub> O <sub>3</sub>	N/A	Catalyst
ZrO <sub>2</sub>	N/A	Bio-medical applications as component of bio-ceramic implants
Fe <sub>3</sub> O <sub>4</sub>	55 (FeO <sub>x</sub> )	Bio-chemical assays, contaminant removal, bio-manipulation

**Table S2.** The Outline Information of Polymerization Techniques Commonly Used for Membrane Surface Coating (Miller et al., 2017)

Technique	Membrane type	Advantage	Disadvantage
UV-induced polymerization	MF, UF	Rapid, simple polymerization	May damage membrane and reduce rejection rate
Chemical-induced small molecule coupling	MF, UF, NF, RO	Permanent polymerization to membrane surface	May require several synthetic steps
Chemically induced polymerization	MF, UF, NF, RO	Permanent polymerization to membrane surface; may increase rejection rate	May decrease water permeability
Plasma polymerization	MF, UF, NF, RO	Rapid polymerization; applicable to many membranes	Require plasma reactor; aggressive treatment may damage membrane
Plasma-induced graft polymerization	MF, UF, NF, RO	Simple polymerization; applicable to many membranes	Require plasma reactor; aggressive treatment may damage membrane
Corona discharge-induced polymerization	MF, UF	Rapid, simple polymerization; applicable to many membranes	Require corona discharge reactor; aggressive treatment may damage membrane
